

PIC18FX410/X490

Programming Specifications for PIC18FX410/X490 FLASH MCUs

1.0 DEVICE OVERVIEW

This document includes the programming specifications for the following devices:

- PIC18F6410
- PIC18F8410
- PIC18F6490
- PIC18F8490

2.0 PROGRAMMING OVERVIEW OF THE PIC18FX410/X490

PIC18FX410/X490 devices can be programmed using the high-voltage In-Circuit Serial Programming™ (ICSP™) method. This can be done with the device in the user's system. This programming specification applies to PIC18FX410/X490 devices in all package types.

2.1 Hardware Requirements

In High-Voltage ICSP mode, the PIC18FX410/X490 devices require two programmable power supplies: one for VDD and one for MCLR/VPP. Both supplies should have a minimum resolution of 0.25V. Refer to **Section 6.0 “AC/DC Characteristics Timing Requirements for Program/Verify Test Mode”** for additional hardware parameters.

2.2 Pin Diagrams

The pin diagrams for the PIC18FX410/X490 family are shown in Figure 2-1 through Figure 2-4.

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING): PIC18FX410/X490

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
RG5/MCLR/VPP	VPP	P	Programming Enable
VDD ⁽¹⁾	VDD	P	Power Supply
VSS ⁽¹⁾	VSS	P	Ground
RB6/PGC	PGC	I	Serial Clock
RB7/PGD	PGD	I/O	Serial Data

Legend: I = Input, O = Output, P = Power

Note 1: All power supply (VDD) and ground (VSS) must be connected.

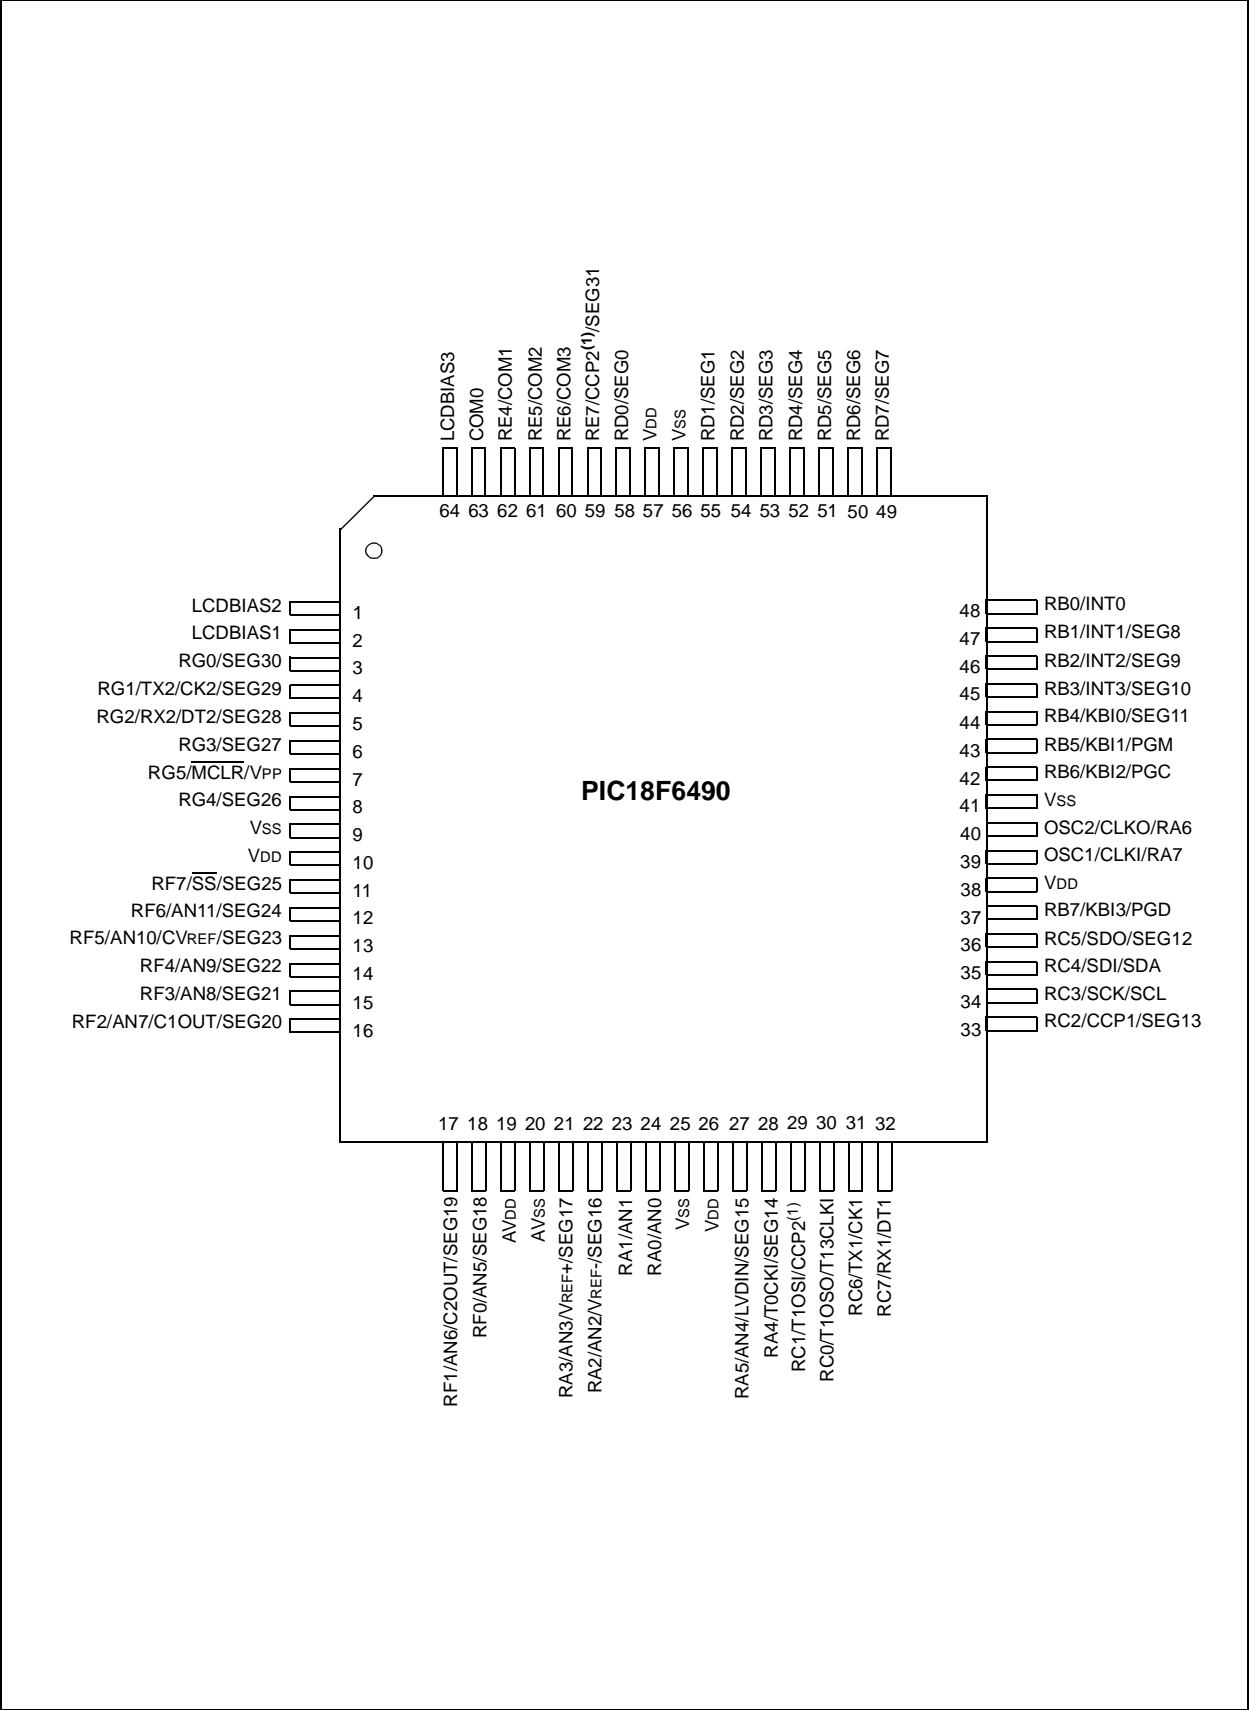

FIGURE 2-4: PIC18FX490 FAMILY PIN DIAGRAM (CONTINUED)

PIC18FX410/X490

2.3 Memory Map

The code memory space extends from 000000h to 003FFFh (16 Kbytes) in a single block.

TABLE 2-2: IMPLEMENTATION OF CODE MEMORY

Device	Code Memory Size (Bytes)
PIC18F6410	000000h-003FFFh (16K)
PIC18F8410	
PIC18F6490	
PIC18F8490	

In addition to the code memory space, there are three blocks in the configuration and ID space that are accessible to the user through table reads and table writes (in ICSP mode). Their locations in the memory map are shown in Figure 2-5.

Users may store identification information (user ID) in eight ID registers. These ID registers are mapped in addresses 200000h through 200007h. The ID locations read out normally, even after code protection is applied.

Locations 300000h through 30000Dh are reserved for the configuration bits. These bits select various device options and are described in **Section 5.0 “Configuration Word”**. These configuration bits read out normally, even after code protection.

Locations 3FFFFEh and 3FFFFFh are reserved for the device ID bits. These bits are read-only bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.0 “Configuration Word”**. These device ID bits read out normally, even after code protection.

2.3.1 MEMORY ADDRESS POINTER

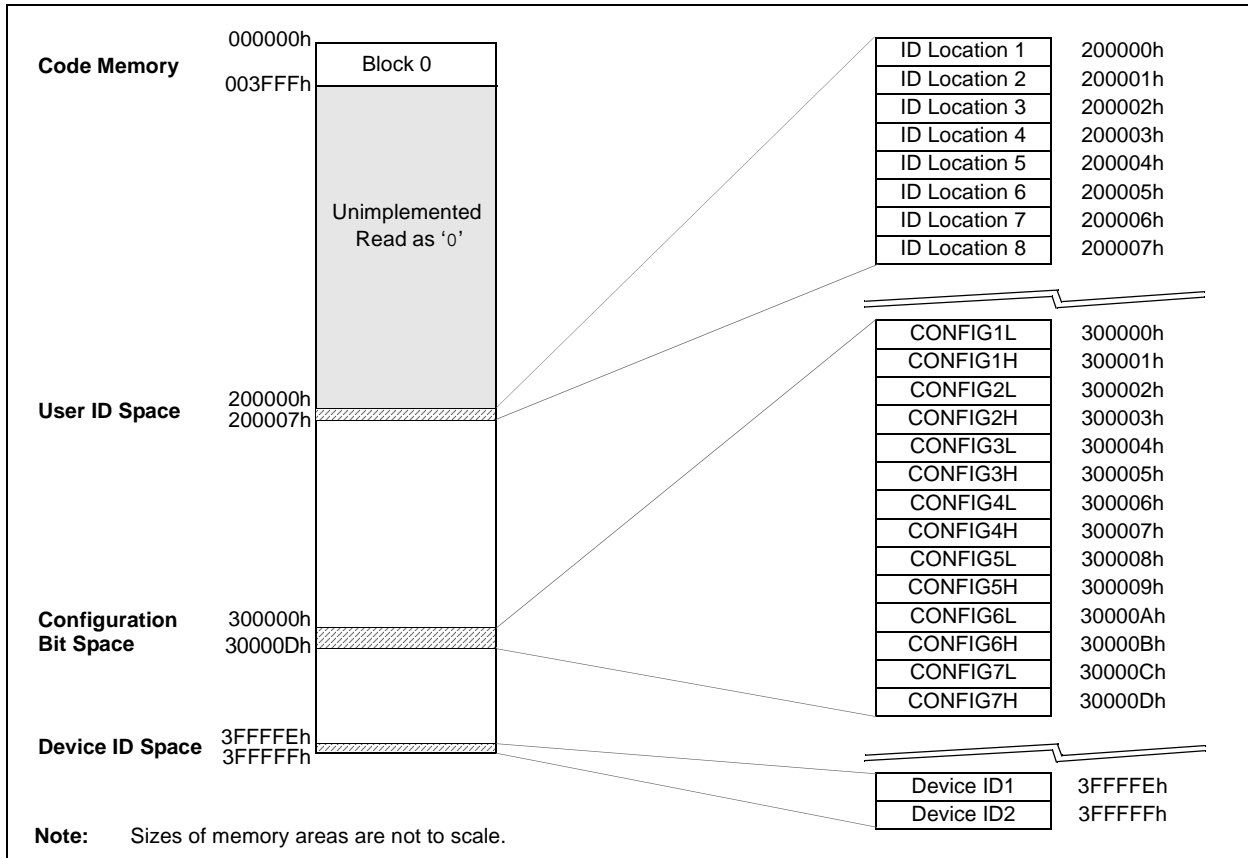

Memory in the address space 0000000h to 3FFFFFFh is addressed via the Table Pointer, which is comprised of three pointer registers:

- TBLPTRU, at RAM address 0FF8h
- TBLPTRH, at RAM address 0FF7h
- TBLPTRL, at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr[21:16]	Addr[15:8]	Addr[7:0]

The 4-bit command, ‘0000’ (core instruction), is used to load the Table Pointer prior to using many read or write operations.

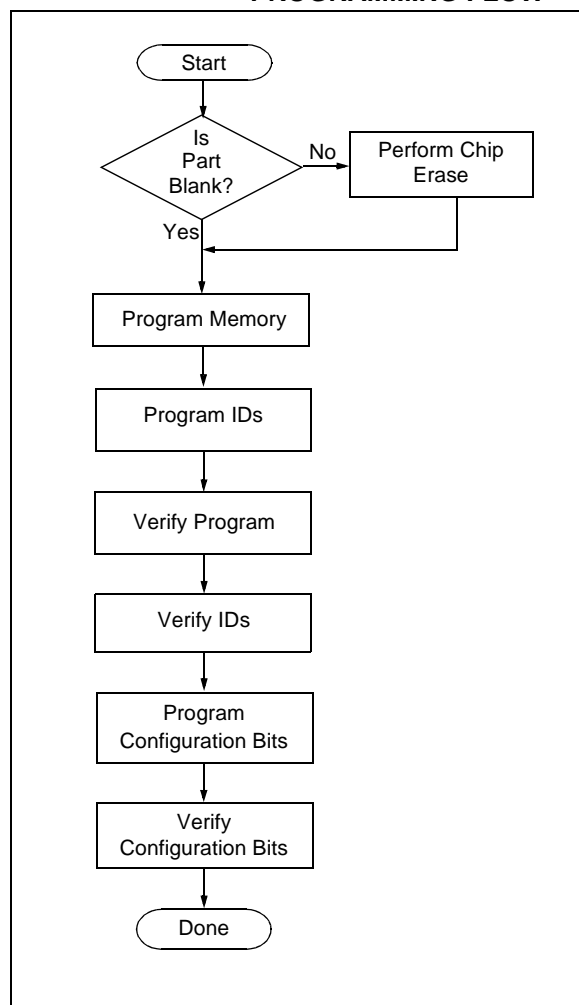

FIGURE 2-5: MEMORY MAP AND THE CODE MEMORY SPACE FOR PIC18FX410/X490 DEVICES

2.4 High-Level Overview of the Programming Process

Figure 2-6 shows the high-level overview of the programming process. The device is first checked to see if it is blank; if it is not, a Chip Erase is performed. Next, the code memory and ID locations are programmed. These memories are then verified to ensure that programming was successful. If no errors are detected, the configuration bits are then programmed and verified.

FIGURE 2-6: HIGH-LEVEL PROGRAMMING FLOW

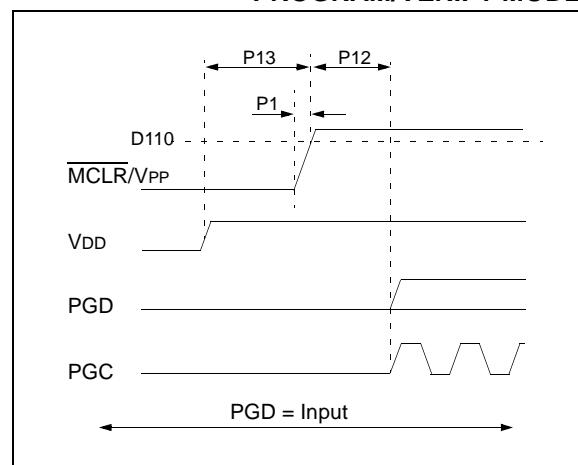

2.5 Entering High-Voltage ICSP Program/Verify Mode

The High-Voltage ICSP Program/Verify mode is entered by holding PGD and PGD low and then raising $\overline{\text{MCLR}}/\text{VPP}$ to V_{IH} (high voltage). Once in this mode, the code memory, ID locations and configuration bits can be accessed and programmed in serial fashion.

The sequence that enters the device into the Program/Verify mode places all unused I/Os in the high-impedance state.

FIGURE 2-7: ENTERING HIGH-VOLTAGE PROGRAM/VERIFY MODE

PIC18FX410/X490

2.6 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.6.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command, followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-3.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-4. The 4-bit command is shown MSb first. The command operand, or "Data Payload", is shown <MSB><LSB>. Figure 2-8 demonstrates how to serially present a 20-bit command/operand to the device.

2.6.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to setup registers as appropriate for use with other commands.

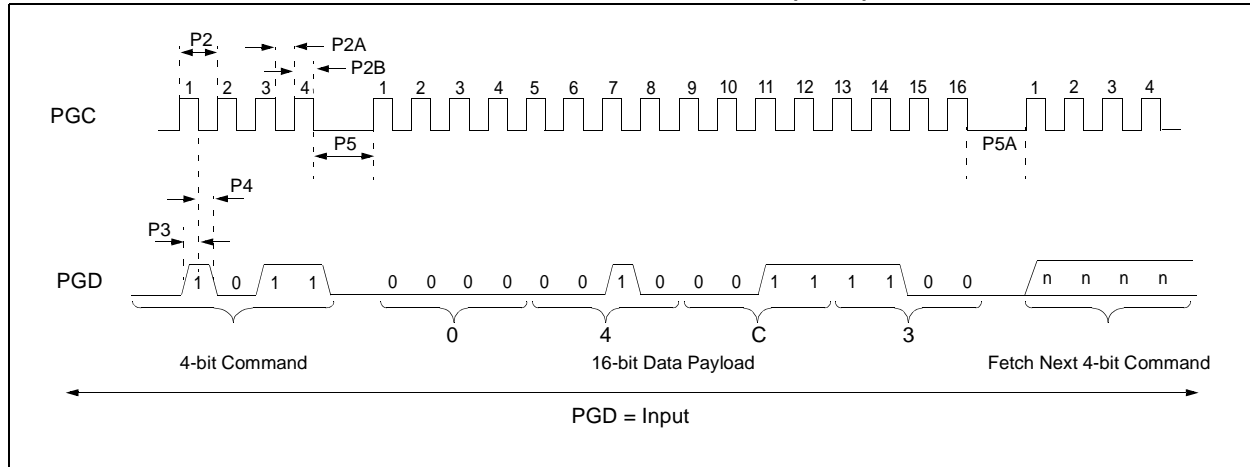

TABLE 2-3: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in 16-bit instruction)	0000
Shift out TABLAT register	0010
Table Read	1000
Table Read, post-increment	1001
Table Read, post-decrement	1010
Table Read, pre-increment	1011
Table Write	1100
Table Write, post-increment by 2	1101
Table Write, post-decrement by 2	1110
Table Write, start programming	1111

TABLE 2-4: SAMPLE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
1101	3C 40	Table Write, post-increment by 2

FIGURE 2-8: TABLE WRITE, POST INCREMENT TIMING (1101)

3.0 DEVICE PROGRAMMING

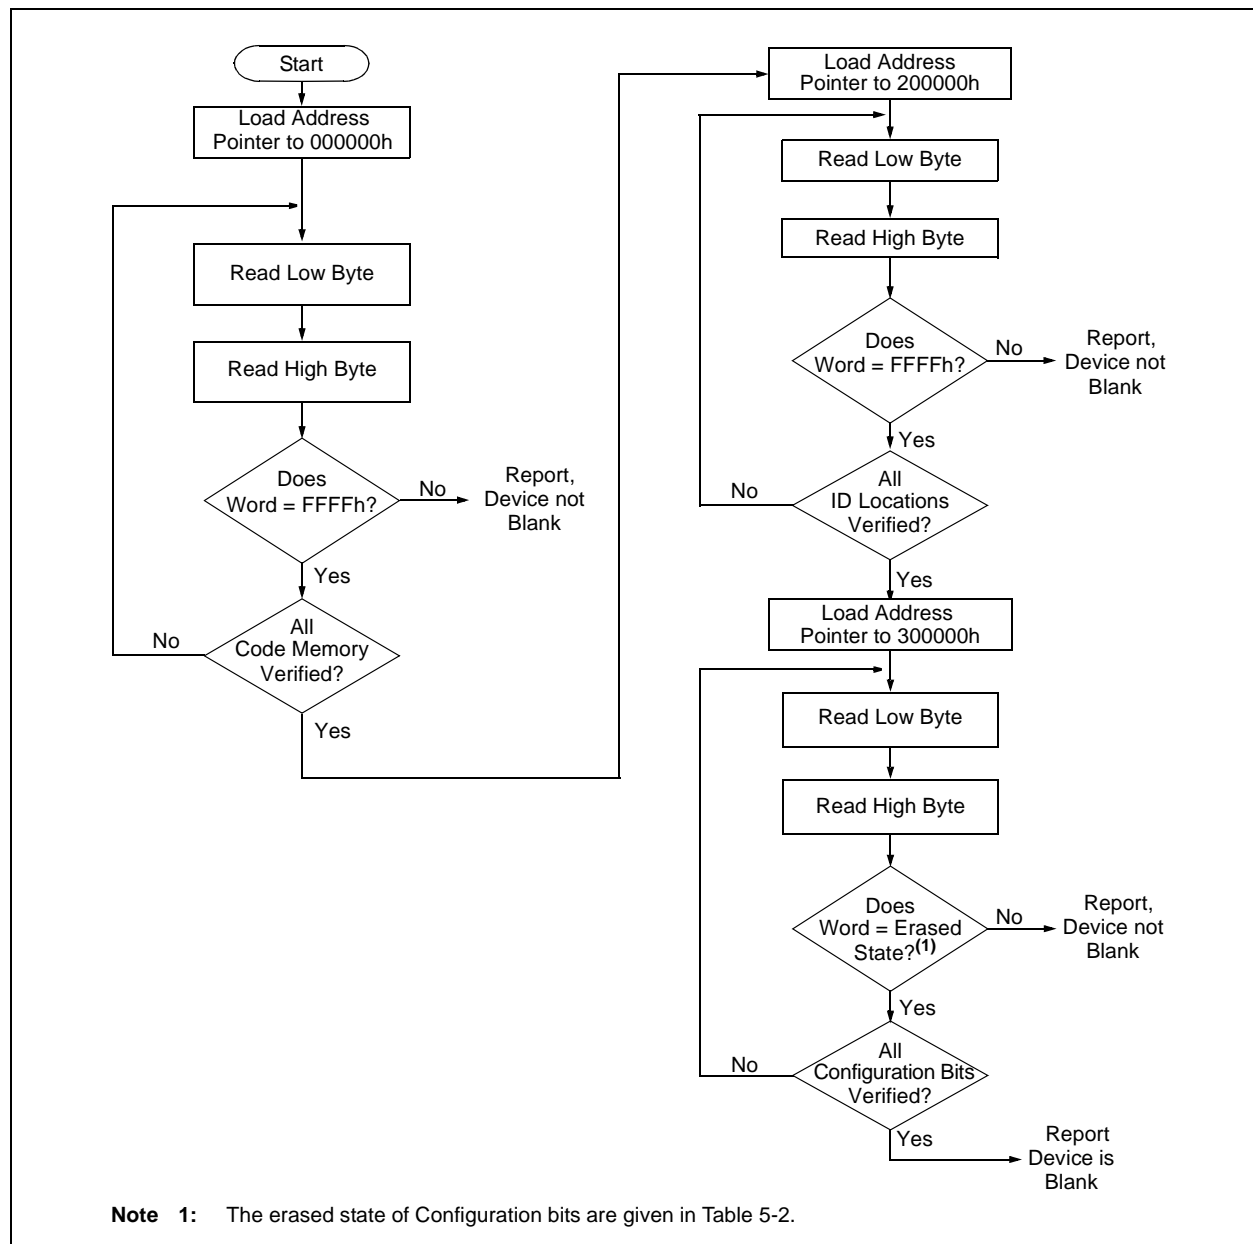

3.1 Blank Check

The term “Blank Check” means to verify that the device has no programmed memory cells. All memories must be verified: code memory, ID locations and configuration bits. The Device ID registers (3FFFFEh:3FFFFFh) should be ignored. The blank checking step involves reading the code memory space and comparing it against FFFFh. Memory reads occur a single byte at a time, so two bytes must be read to compare against FFFFh. Refer to **Section 4.1 “Read Code Memory, ID Locations and Configuration Bits”**.

A “Blank” or “Erased” memory cell will read as a ‘1’. So, “Blank Checking” a device merely means to verify that all bytes read as FFh, except the configuration bits. Unused (reserved) configuration bits will read ‘0’. Refer to Table 5-3 for blank configuration except data for the various PIC18FX410/X490 devices.

If it is determined that the device is not blank, then the device should be erased (see **Section 3.2 “High-Voltage ICSP Chip Erase”**) before any attempt to program is made.

FIGURE 3-1: BLANK CHECK FLOW

Erasing code is accomplished by writing an “erase option” to address 3C0004h. Code memory is erased by erasing the entire device in one action. “Chip Erase” operations will also clear any code-protect settings. Chip Erase is detailed in Table 3-1.

Description	Data
Chip Erase	018Ah

The code sequence to erase the entire device is shown in Table 3-2 and the flow chart is shown in Figure 3-2.

Note:	A Chip Erase is the only way to reprogram code-protect bits from an on-state to an off-state.
--------------	---

4-Bit Command	Data Payload	Core Instruction
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVLW 05h
0000	6E F6	MOVWF TBLPTRL
1100	01 0A	Write 01 to 3C0005h
0000	0E 04	MOVLW 04h
0000	6E F6	MOVWF TBLPTRL
1100	01 8A	Write 8Ah TO 3C0004h to erase device.
0000	00 00	NOP
0000		Hold PGD low until erase completes.

```
graph TD; Start([Start]) --> Load[Load Address Pointer to 3C0004h]; Load --> Write[Write 018Ah To Erase Device]; Write --> Delay[Delay P11+P10 Time]; Delay --> Done([Done]);
```

The diagram illustrates the timing relationship between the PGC (Program/Global Clock) and PGD (Program/Global Data) signals during a Chip Erase operation. The PGC signal is a periodic clock with pulses numbered 1 through 16, with gaps labeled P5, P5A, and P11. The PGD signal shows the data bus activity: 4-bit Command (0011), 16-bit Data Payload (01), 4-bit Command (0000), 16-bit Data Payload (00), 4-bit Command (0000), Erase Time, and 16-bit Data Payload (nn). The PGD signal is labeled as PGD = Input.

3.3 Code Memory Programming

Programming code memory is accomplished by first loading data into the appropriate write buffers and then initiating a programming sequence. The write buffer is 16 bytes in size and can be mapped to any 16-byte area in code memory (see Figure 3-4). The actual memory write sequence takes the contents of these buffers and programs the 16-byte code memory region pointed to by the Table Pointer once the programming sequence is initiated.

The programming duration is externally timed and is controlled by PGC. After a "Start Programming" command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9 (see Figure 3-6).

After PGC is brought low, the programming sequence is terminated. PGC must be held low for the time specified by parameter P10 to allow high-voltage discharge of the memory array.

The code sequence to program a PIC18FX410/X490 device is shown in Table 3-3. The flow chart shown in Figure 3-5 depicts the logic necessary to completely write a PIC18FX410/X490 device. The timing diagram that details the "Start Programming" command and parameter P10, is shown in Figure 3-6.

Note: The TBLPTR register must contain the same offset value when initiating the programming sequence as it did when the write buffers were loaded.

FIGURE 3-4: WRITE BOUNDARIES

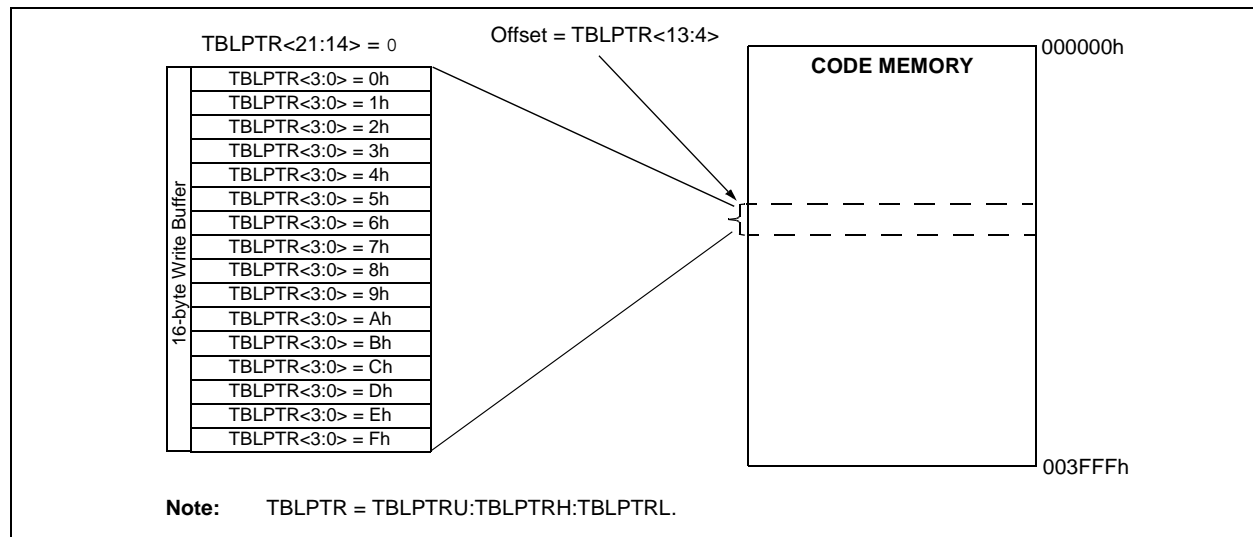

TABLE 3-3: WRITE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory and enable writes.		
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Load write buffer.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
1101	<LSB><MSB>	Write 2 bytes (First Word) and post-increment address by 2
.	.	.
1101	<LSB><MSB>	Write 2 bytes (Seventh Word) and post-increment address by 2
1111	<LSB><MSB>	Write 2 bytes (Eighth Word) and start programming
0000	00 00	NOP - Hold SCLK high for P9 time
To continue writing data, repeat step 2, where the address pointer is incremented by 16 at each iteration of the loop.		

PIC18FX410/X490

FIGURE 3-5: PROGRAM CODE MEMORY FLOW

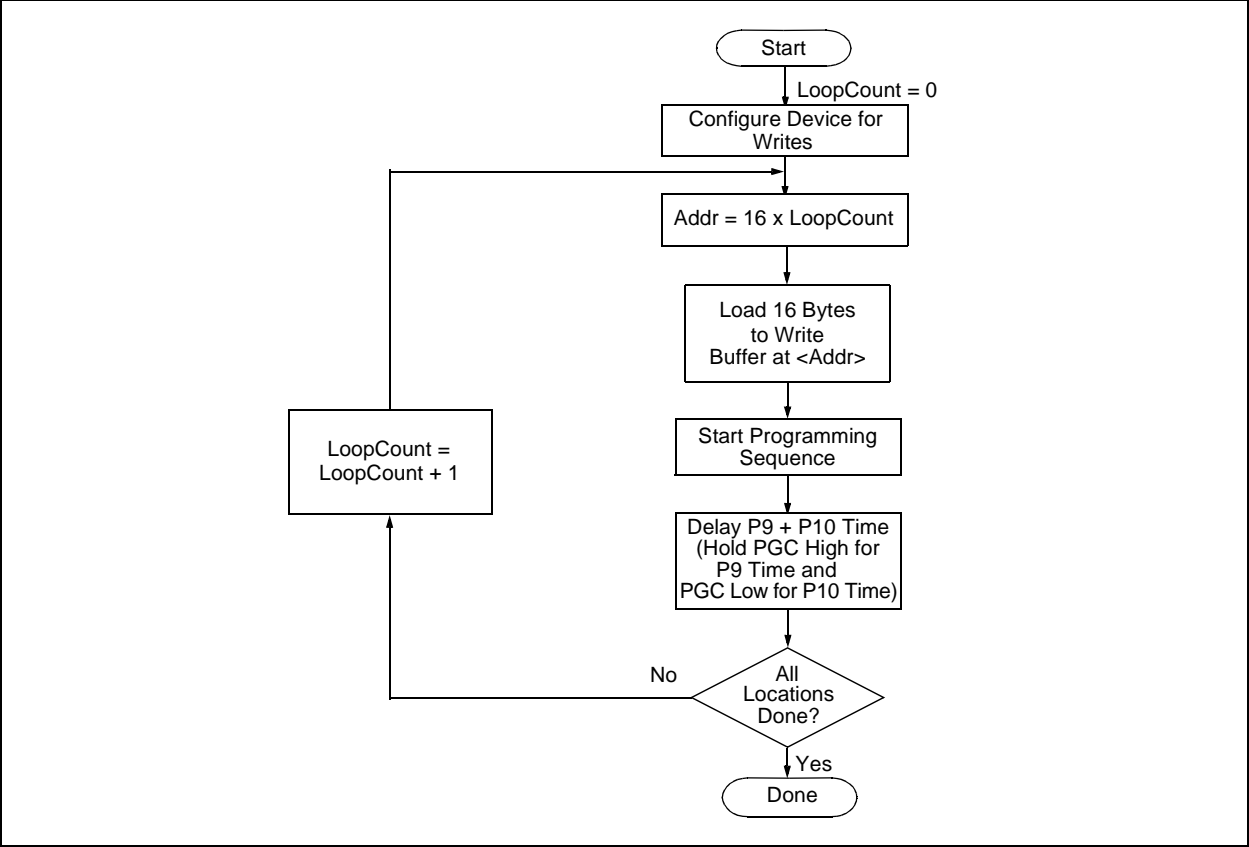

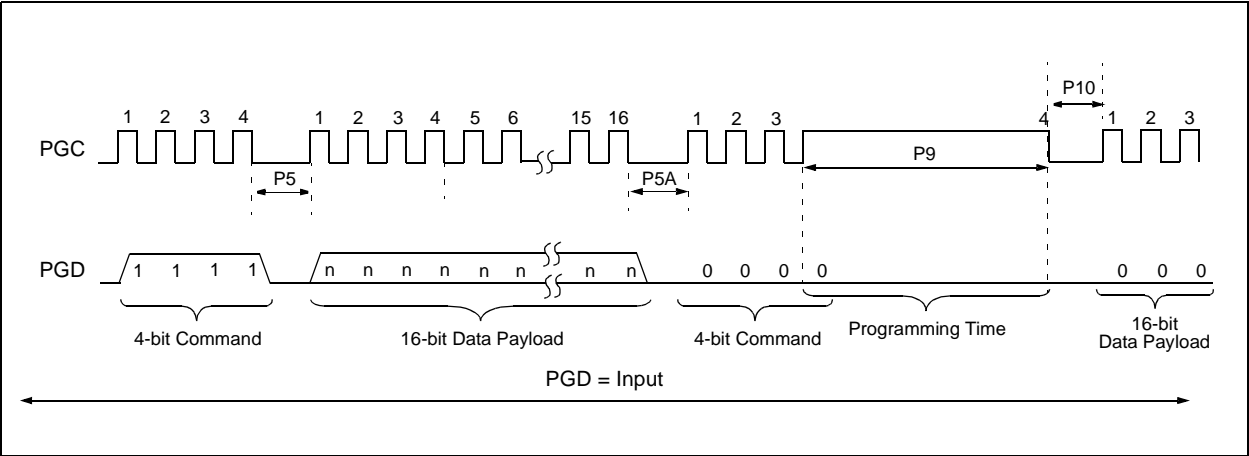

FIGURE 3-6: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING (1111)

3.4 ID Location Programming

The ID locations are programmed much like the code memory. The ID registers are mapped in addresses 200000h through 200007h. These locations read out normally, even after code protection.

Note: The user only needs to fill the 8-byte data buffer to program the ID locations.

Table 3-4 demonstrates the code sequence required to write the ID locations.

The Table Pointer must be manually set to 200000h (base address of the ID locations). The post-increment feature of the table read 4-bit command should not be used to increment the Table Pointer to 200000h. After setting the Table Pointer to 200000h, the post-increment feature may be used to increment to 200001h, 200002h and so on.

TABLE 3-4: WRITE ID SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
0000	9C A6	BCF EECON1, CFGS
0000	84 A6	BSF EECON1, WREN
Step 2: Load write buffer. Panel will be automatically determined by address.		
0000	0E 20	MOVLW 20h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1101	<LSB><MSB>	Write 2 bytes and post-increment address by 2
1101	<LSB><MSB>	Write 2 bytes and post-increment address by 2
1101	<LSB><MSB>	Write 2 bytes and post-increment address by 2
1111	<LSB><MSB>	Write 2 bytes and start programming
0000	00 00	NOP

PIC18FX410/X490

3.5 Boot Block Programming

The device PIC18FX410/X490 does not have any Boot Block segment. When the PIC18F8410 device is configured in Microprocessor with Boot Block mode, the locations from 0000h to 07FFh will be internal memory. This memory region is programmed in exactly the same manner as the code memory (see **Section 3.3 “Code Memory Programming”**).

The code sequence detailed in Table 3-3 should be used, except that the address data used in “Step 2” will be in the range of 000000h to 0007FFh.

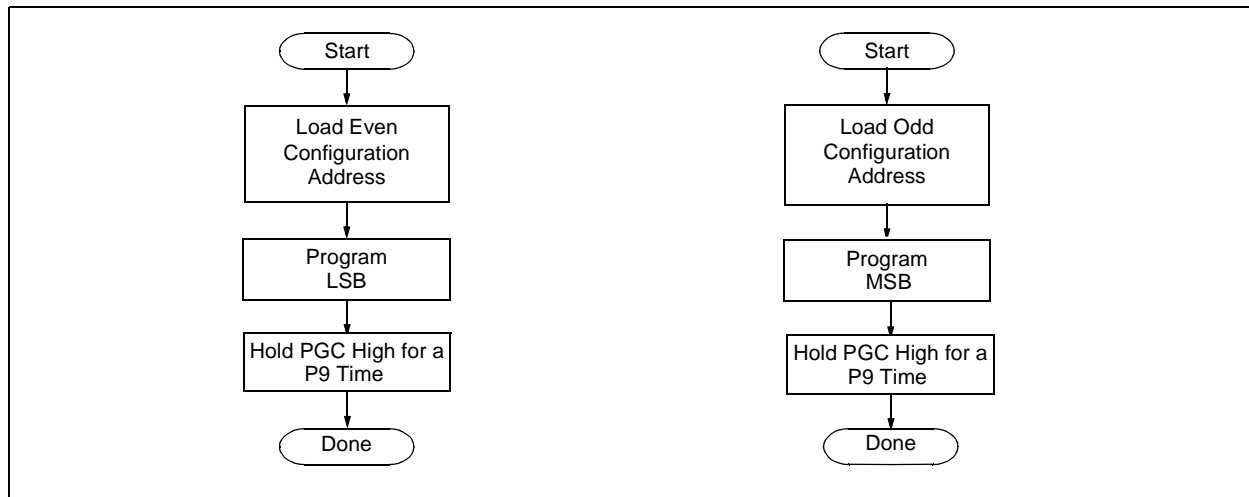

3.6 Configuration Bits Programming

Unlike code memory, the configuration bits are programmed a byte at a time. The write operation programs only 8 bits of the 16-bit payload written. The LSB of the payload will be written to even addresses and the MSB will be written to odd addresses. The code sequence to program two consecutive configuration locations is shown in Table 3-5.

TABLE 3-5: SET ADDRESS POINTER TO CONFIGURATION LOCATION

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to config memory.		
0000	84 A6	BSF EECON1, WREN
0000	8C A6	BSF EECON1, CFGS
Step 2: Set Table Pointer for config byte to be written. Write even addresses.		
0000	0E 30	MOVLW 30h
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPRTH
0000	0E 00	MOVLW 00h
0000	6E F6	MOVWF TBLPTRL
1111	<LSB><MSB ignored>	Load 2 bytes and start programming
0000	00 00	NOP - hold PGC high for time P9
0000	2A F6	INCF TBLPTRL
1111	<LSB ignored><MSB>	Load 2 bytes and start programming
0000	00 00	NOP - hold PGC high for time P9

FIGURE 3-7: CONFIGURATION PROGRAMMING FLOW

4.0 READING THE DEVICE

4.1 Read Code Memory, ID Locations and Configuration Bits

Code memory is accessed one byte at a time via the 4-bit command, '1001' (Table Read, post increment). The contents of memory pointed to by the Table Pointer (TBLPTRU:TBLPTRH:TBLPTRL) is serially output on PGD.

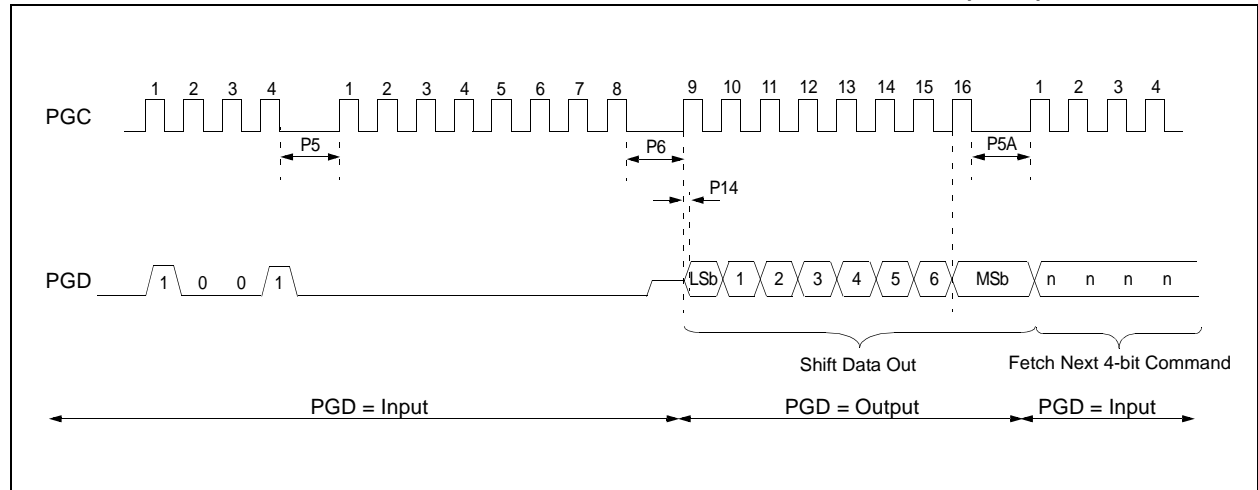

The 4-bit command is shifted in LSb first. The read is executed during the next 8 clocks, then shifted out on PGD during the last 8 clocks, LSb to MSb. A delay of P6 must be introduced after the falling edge of the 8th PGC of the operand to allow PGD to transition from an input to an output. During this time, PGC must be held low (see Figure 4-1). This operation also increments the Table Pointer pointer by one, pointing to the next byte in code memory for the next read.

This technique will work to read any memory in the 000000h to 3FFFFFFh address space, so it also applies to the reading of the ID and Configuration registers.

TABLE 4-1: READ CODE MEMORY SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
0000	8C A6	BCF EECON1, CFGS
Step 1: Set Table Pointer.		
0000	0E <Addr[21:16]>	MOVLW Addr[21:16]
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 2: Read memory into Table Latch and then shift out on PGD, LSb to MSb.		
1001	00 00	TBLRD ++

FIGURE 4-1: TABLE READ POST INCREMENT INSTRUCTION TIMING (1001)

PIC18FX410/X490

4.2 Verify Code Memory and ID Locations

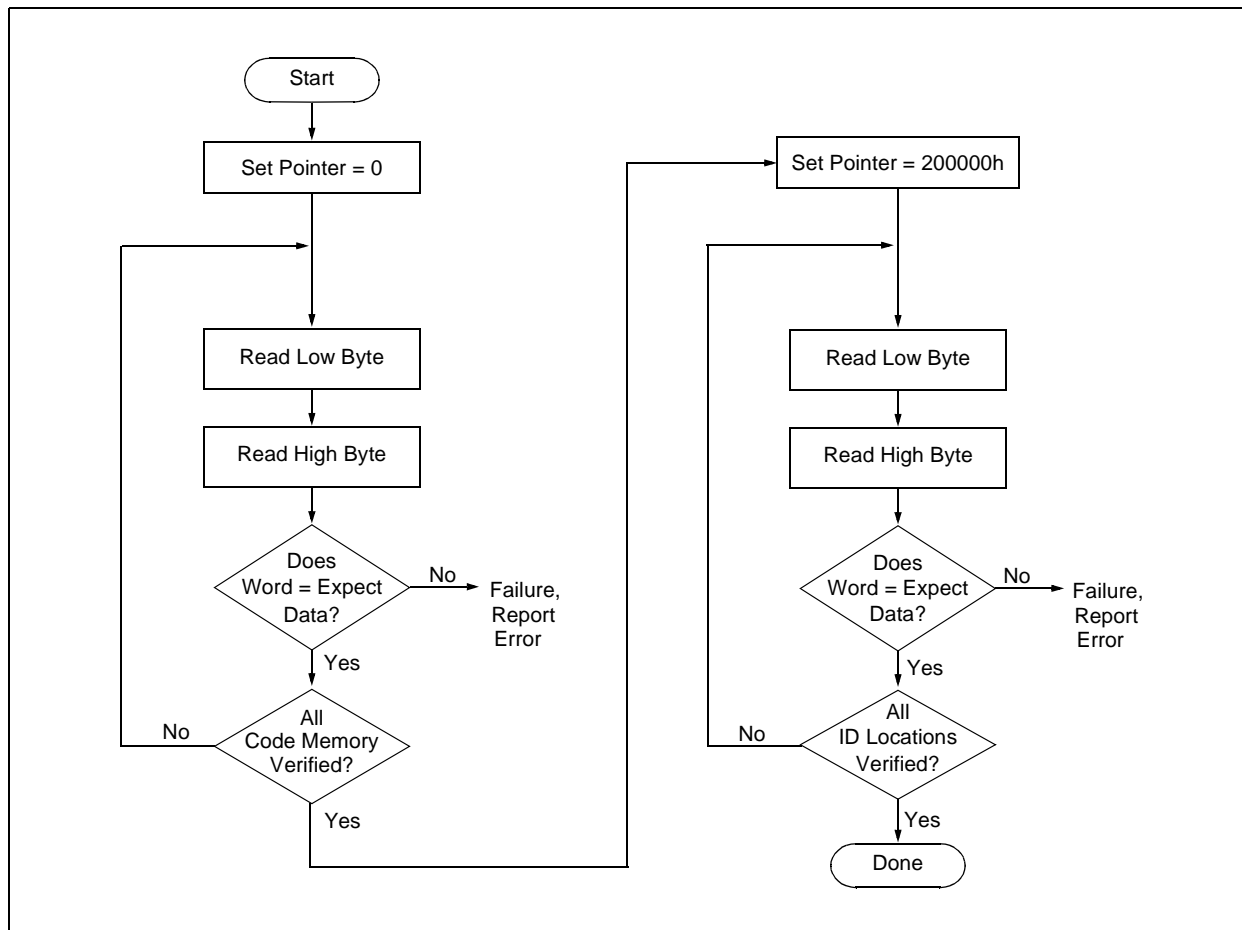

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading code memory.

The Table Pointer must be manually set to 200000h (base address of the ID locations) once the code memory has been verified. The post-increment feature of the table read 4-bit command may not be used to increment the Table Pointer to 200000h. After setting the Table Pointer to 200000h, the post-increment feature may be used to increment to 200001h, 200002h and so on.

4.3 Verify Configuration Bits

A configuration address may be read and output on PGD via the 4-bit command, 1001. Configuration data is read and written in a byte-wise fashion, so it is not necessary to merge two bytes into a word prior to a compare. The result may then be immediately compared to the appropriate configuration data in the programmer's memory for verification. Refer to **Section 4.1 "Read Code Memory, ID Locations and Configuration Bits"** for implementation details of reading configuration data.

FIGURE 4-2: VERIFY CODE MEMORY AND ID LOCATIONS FLOW

5.0 CONFIGURATION WORD

The PIC18FX410/X490 devices have several configuration words. These bits can be set or cleared to select various device configurations. All other memory areas should be programmed and verified prior to setting configuration words. These bits may be read out normally, even after read or code-protected. Table 5-2 and Table 5-3 provide information on various configuration bits.

5.1 ID Locations

A user may store identification information (ID) in eight ID locations mapped in 200000h:200007h. It is recommended that the Most Significant nibble of each

ID be 0Fh. In doing so, if the user code inadvertently tries to execute from the ID space, the ID data will execute as a NOP.

5.2 Device ID Word

The device ID word for the PIC18FX410/X490 is located at 3FFFFEh:3FFFFFh. These bits may be used by the programmer to identify what device type is being programmed and read out normally, even after code or read-protected.

TABLE 5-1: DEVICE ID VALUES

Device	Device ID Value	
	DEVID2	DEVID1
PIC18F6410	06h	111x xxxx
PIC18F6490	06h	101x xxxx
PIC18F8410	06h	110x xxxx
PIC18F8490	06h	100x xxxx

Note: The 'x's in DEVID1 contain the device revision code.

TABLE 5-2: PIC18FX410/X490 CONFIGURATION BITS AND DEVICE IDS

File Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Default/ Unprogrammed Value

WAIT ⁽¹⁾	CONFIG3L	External Bus Data Wait Enable bit 1 = Wait selections unavailable 0 = Wait selections determined by WAIT1:WAIT0 bits of MEMCON register
CCP2MX	CONFIG3H	CCP2 MUX bit 1 = CCP2 input/output is multiplexed with RC1 0 = CCP2 input/output is multiplexed with RE7 in Microcontroller mode; CCP2 input/output is multiplexed with RB3 in Microprocessor ⁽¹⁾ mode, Extended Microcontroller mode ⁽¹⁾ or Microprocessor w/ Boot Block mode ⁽¹⁾
LPT1OSC	CONFIG3H	Low-Power Timer1 Oscillator Enable bit 1 = Timer1 oscillator configured for low-power consumption (lower noise immunity) 0 = Timer1 oscillator configured for higher power consumption (high noise immunity)
MCLRE	CONFIG3H	MCLRE Enable bit 1 = $\overline{\text{MCLR}}$ pin enabled, RG5 disabled 0 = RG5 input pin enabled, MCLR disabled
STVREN	CONFIG4L	Stack Overflow/Underflow Reset Enable bit 1 = Stack overflow/underflow will cause Reset 0 = Stack overflow/underflow will not cause Reset
XINST	CONFIG4L	Enhanced CPU Enable bit 1 = Enhanced CPU enabled 0 = Enhanced CPU disabled

Note 1: Unimplemented in PIC18F6410/18FX490 devices; maintain this bit set.

PIC18FX410/X490

TABLE 5-3: PIC18FX410/X490 CONFIGURATION BIT DESCRIPTIONS (CONTINUED)

Bit Name	Configuration Words	Description
DEBUG	CONFIG4L	Background Debugger Enable bit 1 = Background debugger disabled 0 = Background debugger enabled
CP	CONFIG5L	Code Protection bit (code memory area 0000h-3FFFh) 1 = Code memory not code-protected 0 = Code memory code-protected
EBTR	CONFIG7L	Table Read Protection bit (code memory area 0000h-3FFFh) 1 = Code memory not protected from table reads executed in external memory 0 = Code memory protected from table reads executed in external memory
DEV10:DEV3	DEVID2	Device ID bits These bits are used with the DEV2:DEV0 bits in the DEVID1 register to identify part number.
DEV2:DEV0	DEVID1	Device ID bits These bits are used with the DEV10:DEV3 bits in the DEVID2 register to identify part number.
REV4:REV0	DEVID1	These bits are used to indicate the revision of the device.

Note 1: Unimplemented in PIC18F6410/18FX490 devices; maintain this bit set.

5.3 Embedding Configuration Word Information in the HEX File

To allow portability of code, a PIC18FX410/X490 device programmer is required to read the configuration word locations from the hex file. If configuration word information is not present in the hex file, then a simple warning message should be issued. Similarly, while saving a hex file, all configuration word information must be included. An option to not include the configuration word information may be provided. When embedding configuration word information in the hex file, it should start at address 300000h.

Microchip Technology Inc. feels strongly that this feature is important for the benefit of the end customer.

Table 5-4 describes how to calculate the checksum for each device.

Note: The checksum calculation differs depending on the code-protect setting. Since the code memory locations read out differently, depending on the code-protect setting, the table describes how to manipulate the actual code memory values to simulate the values that would be read from a protected device. When calculating a checksum by reading a device, the entire code memory can simply be read and summed. The configuration word and ID locations can always be read.

5.4 Checksum Computation

The checksum is calculated by summing the following:

- The contents of all code memory locations
- The configuration word, appropriately masked
- ID locations

The Least Significant 16 bits of this sum are the checksum.

TABLE 5-4: CHECKSUM COMPUTATION

Device	Code-Protect	Checksum	Blank Value	AAh at 0 and Max Address
PIC18F6410/ PIC18F8410/ PIC18F6490/ PIC18F8490	None	SUM(0000:3FFF)+(CONFIG1L & 0000)+(CONFIG1H & 00CF)+(CONFIG2L & 001F)+(CONFIG2H & 001F)+(CONFIG3L & 00C3)+(CONFIG3H & 0085)+(CONFIG4L & 00C1)+(CONFIG4H & 0000)+(CONFIG5L & 0001)+(CONFIG5H & 0000)+(CONFIG6L & 0000)+(CONFIG6H & 0000)+(CONFIG7L & 0001)+(CONFIG7H & 0000)	C20C	C162
	All	(CONFIG1L & 0000)+(CONFIG1H & 002F)+(CONFIG2L & 000F)+(CONFIG2H & 001F)+(CONFIG3L & 0000)+(CONFIG3H & 0083)+(CONFIG4L & 0085)+(CONFIG4H & 0000)+(CONFIG5L & 00FF)+(CONFIG5H & 00C0)+(CONFIG6L & 00FF)+(CONFIG6H & 00E0)+(CONFIG7L & 00FF)+(CONFIG7H & 0040)+SUM(IDs)	0225	0220

Legend: Item Description
 CFGW = Configuration Word
 SUM[a:b] = Sum of locations, a to b inclusive
 SUM_ID = Byte-wise sum of lower four bits of all customer ID locations
 + = Addition
 & = Bit-wise AND

PIC18FX410/X490

6.0 AC/DC CHARACTERISTICS TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE

Standard Operating Conditions Operating Temperature: 25°C is recommended						
Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
D110	VIHH	High-Voltage Programming Voltage on $\overline{\text{MCLR}}/\text{VPP}$	10	12	V	
D111	VDD	Supply Voltage During Programming	2.00	5.50	V	Normal Programming
			2.75	5.50	V	Chip Erase
D112	IPP	Programming Current on $\overline{\text{MCLR}}/\text{VPP}$	—	100	mA	
D113	IDDP	Supply Current During Programming	—	1	mA	
D031	VIL	Input Low Voltage	VSS	0.2 VDD	V	
D041	VIH	Input High Voltage	0.8 VDD	VDD	V	
D080	VOL	Output Low Voltage	—	0.6	V	IOL = 8.5 mA @ 4.5V
D090	VOH	Output High Voltage	VDD – 0.7	—	V	IOH = -3.0 mA @ 4.5V
D012	CIO	Capacitive Loading on I/O pin (PGD)	—	50	pF	To meet AC specifications
P1	TR	$\overline{\text{MCLR}}/\text{VPP}$ Rise Time to enter Program/Verify mode	—	1.0	μs	(See Note 1)
P2	TPGC	Serial Clock (PGC) Period	100	—	ns	VDD = 5.0 V
			1	—	μs	VDD = 2.0 V
P2A	TPGCL	Serial Clock (PGC) Low Time	40	—	ns	VDD = 5.0 V
			400	—	ns	VDD = 2.0 V
P2B	TPGCH	Serial Clock (PGC) High Time	40	—	ns	VDD = 5.0 V
			400	—	ns	VDD = 2.0 V
P3	TSET1	Input Data Setup Time to Serial Clock ↓	15	—	ns	
P4	THLD1	Input Data Hold Time from PGC ↓	15	—	ns	
P5	TDLY1	Delay between 4-bit Command and Command Operand	40	—	ns	
P5A	TDLY1A	Delay between 4-bit Command Operand and next 4-bit Command	40	—	ns	
P6	TDLY2	Delay between Last PGC ↓ of Command Byte to First PGC ↑ of Read of Data Word	200	—	ns	
P9	TDLY5	PGC High Time (minimum programming time)	2	—	ms	
P10	TDLY6	PGC Low Time after Programming (high-voltage discharge time)	120	—	μs	
P11	TDLY7	Delay to allow Self-Timed Data Write or Chip Erase to occur	30	—	ms	
P12	THLD2	Input Data Hold Time from $\overline{\text{MCLR}}/\text{VPP}$ ↑	2	—	μs	
P13	TSET2	VDD ↑ Setup Time to $\overline{\text{MCLR}}/\text{VPP}$ ↑	100	—	ns	
P14	TVALID	Data Out Valid from PGC ↑	10	—	ns	

Note 1: Do not allow excess time when transitioning $\overline{\text{MCLR}}$ between VIL and VIH; this can cause spurious program executions to occur. The maximum transition time is:

- 1 TCY + TPWRT (if enabled) + 1024 TOSC (for LP, HS, HS/PLL and XT modes only) +
- 2 ms (for HS/PLL mode only) + 1.5 μs (for EC mode only)

where TCY is the Instruction Cycle Time, TPWRT is the Power-up Timer Period and TOSC is the Oscillator Period. For specific values, refer to the Electrical Characteristics section of the Device Data Sheet for the particular device.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is intended through suggestion only and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. No representation or warranty is given and no liability is assumed by Microchip Technology Incorporated with respect to the accuracy or use of such information, or infringement of patents or other intellectual property rights arising from such use or otherwise. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELoQ, MPLAB, PIC, PICmicro, PICSTART, PRO MATE and PowerSmart are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

Amplab, FilterLab, microID, MXDEV, MXLAB, PICMASTER, SEEVAL, SmartShunt and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==

Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELoQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
